

Methodology

I first selected Pune because it has a strong ecosystem of defence, aerospace, precision engineering, automation, biotech, and specialty manufacturing companies. These industries closely match the “Federer company” profile mentioned in the assignment.

I started by searching companies using keywords like “Pune aerospace companies”, “Pune defence manufacturers”, “Pune industrial automation companies”, and “Pune precision engineering firms” through Google, LinkedIn, startup databases, and company websites.

Initially, I collected a larger raw list of companies. After that, I filtered companies based on the following conditions:

- They should make real technical or industrial products.
- They should have manufacturing, R&D, or engineering operations.
- They should show growth signals such as expansion, exports, defence contracts, EV growth, automation demand, or global partnerships.
- They should operate in sectors with long-term market potential.
- Preference was given to founder-led or technically driven companies.

After filtering, I shortlisted the strongest companies and scored them using factors like product complexity, manufacturing capability, growth potential, innovation, and strategic market positioning.

Finally, I added personalization hooks for each company to explain why DeepThought’s execution systems and operational workflows could be valuable for them.
